

## WHAT IS CLAIMED IS:

- 1 1. A system for bias control of a power amplifier, comprising:
  - 2 a carrier amplifier coupled to an input stage for amplifying an input signal; and
  - 3 a peak amplifier coupled to the input stage for amplifying the input signal, the peak
  - 4 amplifier configured to receive a voltage control signal for biasing the peak
  - 5 amplifier, the voltage control signal based on power levels of signals transmitted by
  - 6 a remote base station.
- 1 2. The system of claim 1, wherein the carrier amplifier further comprises
  - 2 a carrier first stage amplifier coupled to the input stage; and
  - 3 a carrier second stage amplifier coupled to the carrier first stage amplifier and a carrier
  - 4 amplifier output terminal.
- 1 3. The system of claim 1, wherein the peak amplifier further comprises
  - 2 a peak first stage amplifier coupled to the input stage; and
  - 3 a peak second stage amplifier coupled to the peak first stage amplifier and a peak amplifier
  - 4 output terminal; and
  - 5 a voltage control unit coupled to the peak second stage amplifier, the voltage control unit
  - 6 configured to bias the peak amplifier via the received voltage control signal.
- 1 4. The system of claim 3, wherein the voltage control unit biases the peak amplifier as a class
  - 2 B or a class C amplifier based upon a state of the received voltage control signal.

- 1 5. The system of claim 3, wherein the voltage control unit biases the peak amplifier as a class  
2 AB amplifier based upon a state of the received voltage control signal.
- 1 6. The system of claim 1, wherein the power amplifier is configured to generate the voltage  
2 control signal in a first state if the power levels of the signals transmitted by the remote base station  
3 indicate that the power amplifier operates in a low output power range.
- 1 7. The system of claim 1, wherein the power amplifier is configured to generate the voltage  
2 control signal in a second state if the power levels of the signals transmitted by the remote base  
3 station indicate that the power amplifier operates in a high output power range.
- 1 8. The system of claim 1, further comprising a 3dB hybrid coupler configured to receive the  
2 input signal from the input stage, send a first input signal to an input of the carrier amplifier, and  
3 send a second input signal to an input of the peak amplifier, the second input signal shifted in  
4 phase by approximately ninety degrees from the first input signal.
- 1 9. The system of claim 8, further comprising an output matching unit configured to receive an  
2 output signal from the peak amplifier and an output signal from the carrier amplifier to generate a  
3 substantially optimum power amplifier output power signal at an output stage.
- 1 10. The system of claim 9, wherein the output matching unit further comprises  
2 a first quarter wavelength transformer coupled to a carrier amplifier output terminal; and  
3 a second quarter wavelength transformer coupled to a peak amplifier output terminal, an  
4 output of the first quarter wavelength transformer, and the output stage.

- 1 11. A method for bias control of a power amplifier, comprising:
  - 2 receiving signals transmitted by a remote base station;
  - 3 generating a voltage control signal based upon power levels of the signals; and
  - 4 biasing a peak amplifier of the power amplifier via the voltage control signal.
- 1 12. The method of claim 11, wherein the generating further comprises the step of generating the
  - 2 voltage control signal in a first state if the power levels of the signals indicate that the power
  - 3 amplifier operates in a low output power range.
- 1 13. The method of claim 12, wherein the voltage control signal in the first state biases the peak
  - 2 amplifier as a class B or a class C amplifier.
- 1 14. The method of claim 11, wherein the generating further comprises the step of generating the
  - 2 voltage control signal in a second state if the power levels of the signals indicate that the power
  - 3 amplifier operates in a high output power range.
- 1 15. The method of claim 14, wherein the voltage control signal in the second state biases the
  - 2 peak amplifier as a class AB amplifier.

1 16. A system for controlling a power amplifier in a mobile handset, comprising:  
2 a carrier amplifier having a carrier input terminal and a carrier output terminal;  
3 a peak amplifier having a peak input terminal, a peak output terminal and a control  
4 terminal for receiving a voltage control signal, the peak amplifier configured to  
5 vary at least one characteristic of the power amplifier based upon the voltage  
6 control signal;  
7 a phase shifter, coupled to the carrier input terminal and the peak input terminal, for  
8 generating a peak amplifier input signal delayed in phase from a carrier amplifier  
9 input signal; and  
10 an output matching unit, coupled to the carrier output terminal and the peak output  
11 terminal, for transmitting a carrier output power signal and a peak output power  
12 signal and forming a power amplifier output power signal at a power amplifier  
13 output stage.

1 17. The system of claim 16, further comprising a baseband modem chipset for receiving signals  
2 transmitted by a remote base station and generating the voltage control signal in a first voltage  
3 state if power levels of the received signals indicate that the power amplifier operates within a low  
4 power range and generating the voltage control signal in a second voltage state if the power levels  
5 of the received signals indicate that the power amplifier operates within a high power range.

1 18. The system of claim 16, wherein the phase shifter is a hybrid coupler for distributing certain  
2 input powers to the carrier amplifier and the peak amplifier.

1 19. The system of claim 18, wherein the hybrid coupler is a 3dB hybrid coupler implemented  
2 with lumped elements.

1 20. The system of claim 18, wherein the hybrid coupler is implemented by the Low  
2 Temperature Co-fired Ceramic (LTCC) method.

1 21. The system of claim 16, wherein the phase shifter is a phase difference compensator.

1 22. The system of claim 21, wherein the phase difference compensator is implemented with a  
2 transmission line.

1 23. The system of claim 21, wherein the phase difference compensator is implemented with  
2 lumped elements.

1 24. The system of claim 16, wherein the output matching unit is implemented with lumped  
2 elements.

1 25. The system of claim 16, wherein the output matching unit is implemented by a Low  
2 Temperature Co-fired Ceramic (LTCC) method.

1 26. The system of claim 16, wherein the at least one characteristic of the power amplifier is  
2 linearity.

1 27. The system of claim 17, wherein the peak amplifier further comprises a voltage control unit  
2 configured to receive the voltage control signal and control a bias current of the peak amplifier  
3 such that the power amplifier is operated as a Doherty-type amplifier when the voltage control  
4 signal is in the first voltage state and the peak amplifier is operated as a class AB amplifier when  
5 the voltage control signal is in the second voltage state.

1 28. The system of claim 16, wherein the output matching unit further comprises  
2 a first transformer having an input coupled to the carrier output terminal and an output  
3 coupled to the peak output terminal; and  
4 a second transformer having an input coupled to the output of the first transformer and an  
5 output coupled to the power amplifier output stage.

1 29. A method of operating a power amplifier in a wireless transmitting device in at least two  
2 modes, the power amplifier including a carrier amplifier and a peak amplifier, the method  
3 comprising:  
4 generating a voltage control signal in a first voltage state if power levels of signals  
5 transmitted by a remote base station and received by the power amplifier indicate that  
6 the power amplifier operates within a low power range;  
7 generating a voltage control signal in a second voltage state if the power levels of signals  
8 transmitted by the remote base station and received by the power amplifier indicate  
9 that the power amplifier operates within a high power range; and  
10 biasing the peak amplifier via the voltage control signal.

- 1 30. The method of claim 29, wherein biasing further comprises the step of biasing the peak  
2 amplifier via the voltage control signal in the first voltage state to operate the power amplifier as a  
3 Doherty-type amplifier.
- 1 31. The method of claim 29, wherein biasing further comprises the step of biasing the peak  
2 amplifier via the voltage control signal in the second voltage state to improve a non-linearity  
3 characteristic of the power amplifier.
- 1 32. The method of claim 29, wherein biasing further comprises the step of biasing the peak  
2 amplifier via the voltage control signal in the second voltage state to operate the peak amplifier as  
3 a class AB amplifier.
- 1 33. A system of operating a power amplifier in a wireless transmitting device in at least two  
2 modes, the power amplifier including a carrier amplifier and a peak amplifier, the method  
3 comprising:  
4 means for generating a voltage control signal in a first voltage state if power levels of  
5 signals transmitted by a remote base station and received by the power amplifier  
6 indicate that the power amplifier operates within a low power range;  
7 means for generating a voltage control signal in a second voltage state if the power levels of  
8 signals transmitted by the remote base station and received by the power amplifier  
9 indicate that the power amplifier operates within a high power range; and  
10 means for biasing the peak amplifier via the voltage control signal.

1 34. The system of claim 33, wherein means for biasing further comprises means for biasing the  
2 peak amplifier to operate the power amplifier as a Doherty-type amplifier if the voltage control  
3 signal is in the first voltage state.

1 35. The method of claim 33, wherein means for biasing further comprises means for biasing the  
2 peak amplifier to improve a non-linearity characteristic of the power amplifier if the voltage  
3 control signal is in the second voltage state.
